

UX Report 1: Coursera

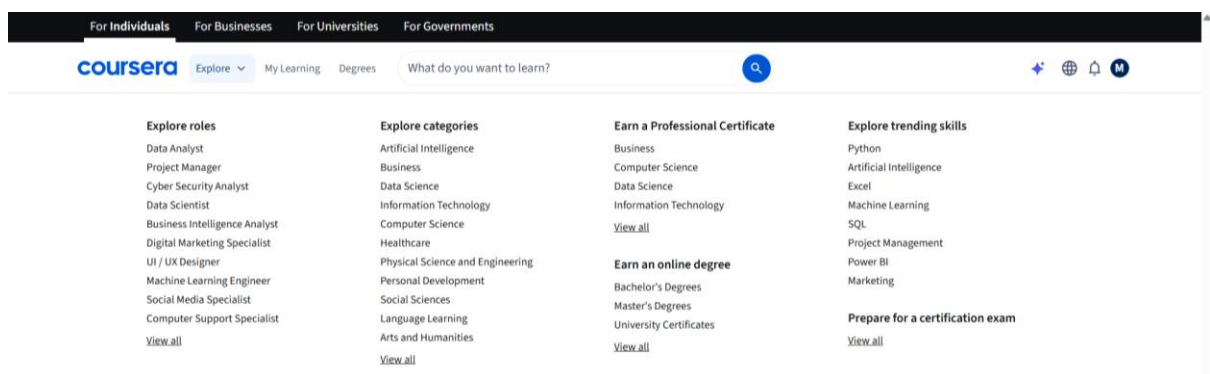

Written by: Frame by Frame

UEQ SHORTENED QUESTIONNAIRE

Obstructive		Supportive
Complicated		Easy
Inefficient		Efficient
Confusing		Clear
Boring		Exciting
Not interesting		Interesting
Conventional		Inventive
Usual		Leading edge

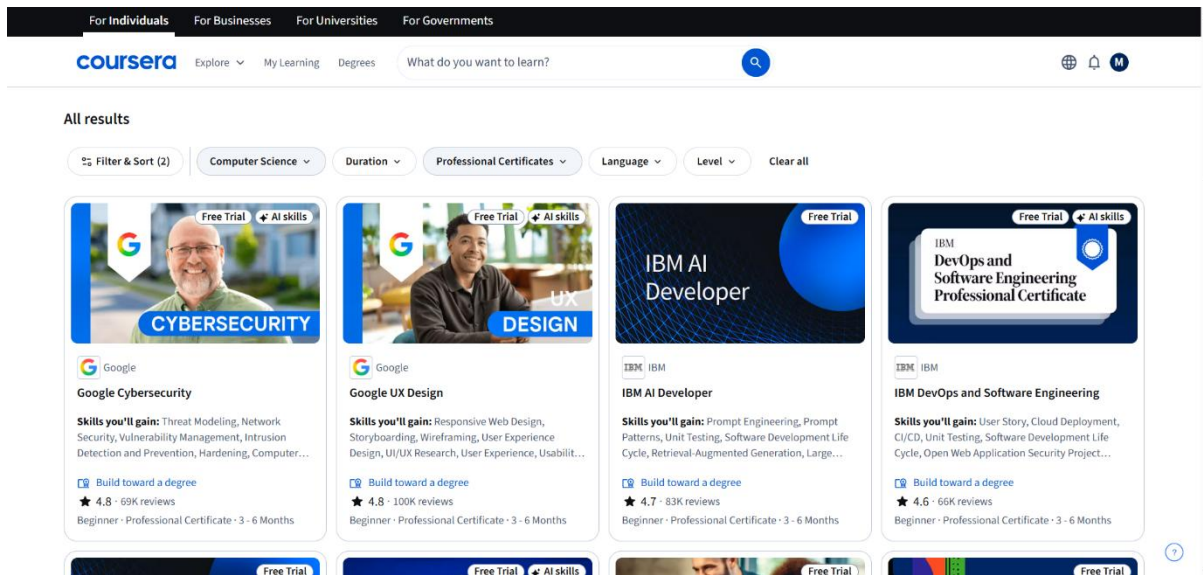

EXPLORE

You can find courses all around the page, but the Explore section on the navbar, which gets bigger when you hover over it, makes it easy for the user to find the certificate that they need more quickly. By using the navbar list, Fitts's Law is satisfied by making the navigation targets large and grouping items by roles, categories, certificates, and skills to minimize the cursor travel distance.

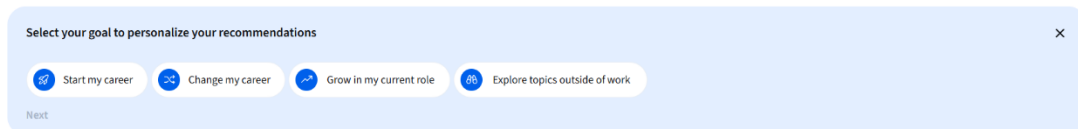

COURSE CATALOGUE

The course catalogue uses cards that elevate when you hover over them. The pictures are engaging, but they could make the course name a bit larger since not all the pictures have the name written on them. The cards, however, are not relevant to our client since they explicitly stated that they do not want cards. The page also has filter and sort options, which make it easier for the user to navigate the app and find their desired courses.

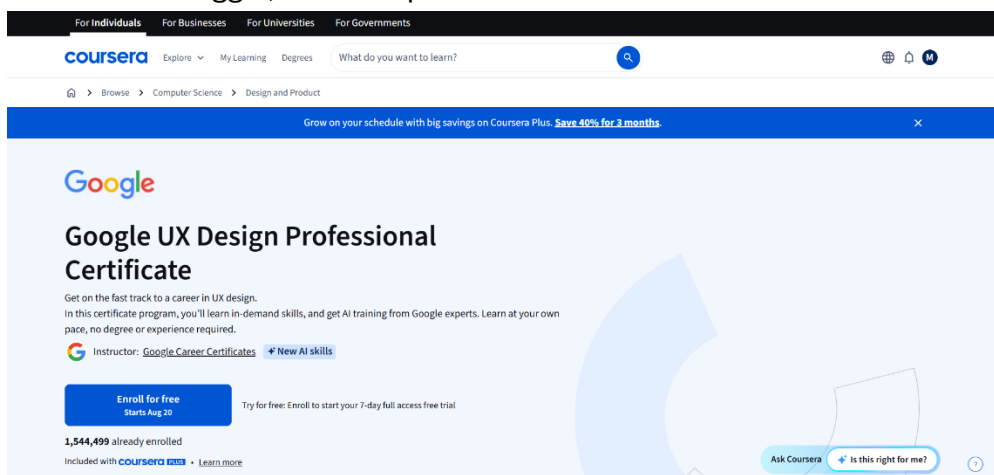

As you scroll down, the app also has a personalization section where it asks you a few questions. The options are presented as large, clearly separated targets, making them easier to select. According to Fitts's Law, larger targets are easier and faster to interact with, so the size and spacing of these options reduce the effort required to select an answer.

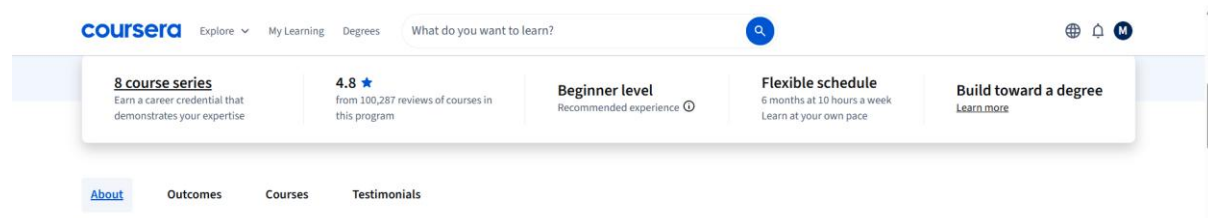

COURSE PAGE

The course page, which focuses on a specific course or certificate, is very clear since it states the name of said course in a huge font as well as a big, blue button that says "Enroll". According to Fitts's law, the larger the target, the faster they are to hit, and because it is bigger, it can be pressed with a thumb.

The course page also has an About, Outcomes, Courses, and Testimonials section that is underlined when you are on that section, and when you press a certain section, it takes you there. All these section choices are positioned close together, reducing the distance the user must move their cursor between them. According to Fitts's law, reducing the distance to a target makes it quicker and easier to reach, allowing users to switch between sections efficiently.

UEQ JUSTIFICATION

The app helped me accomplish my goals, but because it has a lot of information, it took time for me to find the courses; however, the Explore Section that includes the category of each certification/course made it easier to use, as well as the filtering and sorting sections. Because of the confusion because of the information cluster, the app was a little bit harder to learn, time-inefficient (but the filtering and sorting did help improve the efficiency), and confusing. The website, however, was engaging because it includes many pictures and the cards pop up as you hover over them. Coursera is interesting because it not only shows the course/certificate, but it also lists the skills you would gain, the number of reviews, and what level of learner it is for. The website leans more toward innovative since it even includes a personalization section so that it personalises the user's recommendations. The website also feels modern and advanced, hence why it is more toward leading edge.
